Subject: CX Metrics Analysis - Self-Service Channel Insights

Hello Handan,

I hope you're doing well. Thank you for the warm welcome and the opportunity to contribute to the CX team. First of all, I analyzed the data set you provided using python and some data caught my attention. You can review the data I visualized below. Graph 1 shows the number of all complaint types. The 2nd graph is the average CSAT values. And here is my approach:

Summary:

As requested, I focused on analyzing the dataset to pain points and insights to the Self-Service channel. My approach included filtering the dataset to isolate Self-Service orders and analyzing key metrics such as Customer Satisfaction (CSAT) scores, complaint types, and a comparison with the Contact channel.

Key Findings:

1. **Average Satisfaction Scores:**
    - The average CSAT score for the Self-Service channel is **2.78**, which is slightly higher than the **2.73** score for the Contact channel. This **0.05** point difference suggests that while the Self-Service channel is performing slightly better, there is still room for improvement.
2. **Frequent Complaint Types:**
    - The most common complaints in the Self-Service channel are:
        1. **Order Delay:** 3,739 complaints
        2. **Cancellation Requests:** 2,375 complaints
        3. **Missing Item & Wrong Item/Order:** 1,791 complaints
    - These three categories account for the majority of the complaints, suggesting that delays, cancellations, and order inaccuracies are the primary drivers of dissatisfaction in the Self-Service channel.

Final Outcome:

Based on these findings, I recommend the following actions to improve the Self-Service channel:

- **Focus on Order Accuracy and Timeliness:** Refining our processes to ensure timely deliveries and accurate orders could make a big difference in customer satisfaction.

  I recommend prioritizing initiatives that address these common issues, particularly by improving logistics to reduce delays and implementing stricter quality checks to prevent order inaccuracies.
