Subject: Reasons for CSAT Difference and Suggested Improvements to the Flow

Thank you for your feedback on my previous analysis. Below, I'll outline my thoughts on the possible reasons behind the difference and propose a redesign to improve the Self-Service flow.

A) Possible Reasons for the CSAT Difference

1. **Lack of Human Interaction in Self-Service:**
    - In the Contact channel, customers interact with a live person, which can create a sense of empathy and trust, even just hearing, "I understand, and I'm on it," can significantly diffuse tension. Users may feel that a operator is actively trying to resolve their issue, which could enhance their satisfaction. In self-service, users miss out on that comforting assurance that someone is personally handling their issue.
2. **Confusing or Limited Self-Service Options:**
    - The language or design of the self-service flow could be unclear, making it hard for users to find the exact solution they need. They might feel overwhelmed by too many or poorly explained options. Therefore, they may not find the answer they are looking for.
3. **Real-Time Updates or Feedback:**
    - Users may feel uncertain if their delay issue is being worked on or when it will be resolved. Without real-time feedback, they may perceive the Self-Service process as slower and less responsive than speaking with an operator.

B) Suggested Improvements to the Flow

1. **Hybrid Support Option (Human + AI):**
    - Allow users to initiate a *quick chat* with an AI-powered assistant (chatbot) that provides immediate responses. If the issue remains unresolved within a set number of interactions, the AI assistant can direct the issue to an operator.
2. **Simplify the Self-Service Flow with a Clear Step-by-Step Process:**
    - **Current Flow:** Users choose between 'Change in order request' or 'Have a problem with order', which then takes them to a generic Self-Service menu.
    - **Redesigned Flow:** Simplify these steps. Once a delay is detected by the system, offer users a tailored **'***Order Delay Help'* option directly in the main menu, with two clear sub-options:
        - Track Order Status
        - Request Support for Delay

      This reduces confusion and makes it easier for users to resolve the specific issue of an order delay. It will also reduce the number of clicks and streamline their journey.
3. **Real-Time Updates with Clear Expectations:**
    - Include a *real-time update* feature within the Self-Service flow that tells the user the exact current status of their delayed order (e.g., "Your food is still being prepared, and will arrive in 15 minutes").
    - Additionally, provide *compensation options* (like a coupon) automatically for significant delays, avoiding the need for users to contact support.
    - Real-time updates provide transparency may reduce frustration, leading to higher satisfaction even in the event of a delay.
